## Play store account information

Android: Facebook announced their new replacement of the social home screen called Facebook Home last week, and today it is available in the Play Store for certain devices. Facebook is not making your own phone, or a version of Android, because Facebook thinks Android ... Read more Suite Apps puts more emphasis on your friends and social sharing than the separate apps you use to communicate with a new home and lock screen, a new notification area, and (of course) serious Facebook integration. Facebook Home is available for HTC First, HTC One X and One X+, Samsung Galaxy S III and Galaxy Note II. Support for HTC One and Galaxy S4 come in the future along with (hopefully) other devices. Check out the video above to see in action, read our original post for more information, and if you have a supported device, hit the link below to try. Facebook Home (Free) | Google Play Store Update: August 13: Google confirmed the change to TechCrunch, stating that a G+ profile is no longer required to post a review. Rollout is still going, but more and more users are finding themselves able to leave comments without a G+ sign in. After confessing Google's VP for feeds, photos and sharing, Bradley Horowitz confessed in a statement last year that it doesn't make sense for your Google+ profile to be your identity in all the other Google products you use. Original post, August 11: For the longest time, Google pushed Google+ hard. So hard, in fact, and in such envious ways it infuriated a lot of people who were, say, a little less inclined to the niche social network. But following the slow dismantling of Google+ lately, Google now seems to be giving up various implementations of Google+ within the Play Store too. Namely, the +1 button on the app pages and the requirement for a Google+ account to write a review. Flashback: The day Google imposed Google+ on Play Store reviewsAndroid Police has already received some tips indicating that some (but not all) users may be writing reviews in Google Play with a Google account that doesn't have a Google+ profile. (I checked with a non-G+ account and the feature is not available to me, but if you manage to write comments on non-G+ accounts, be sure to let us know.) This does not mean that Google+ is dead, but just a little less confused with other Google services. News tracks previous reports that the +1 button on the app's pages, which is directly linked to Google+, is also removed from the Play Store. Again, the changes are not universal, but they come in the wake of Google+ being cleaned up from other Google properties: connecting with Google+ 1 rebranded as connecting with Google; YouTube's comments have lost their dependence on Photos split from Google+; and Play Games inherited gamer IDs instead of a G+ sign-in. What are your thoughts on Google+? Is Google time off pushing Google+? Tagged: GoogleGoogle Apps People tend to assume that everything is not a way to maximize advertising revenue, which is often true, but this time we can't say it is. Sure, getting a cheap Android tablet in the hands of millions of people will help Google get more revenue from ads because of the increase in eye count, but this time, we think Google is looking for revenue from past ads to the entire Android tablet ecosystem. Finally, that was always the point of Nexus devices. Nexus devices have historically been designed to be reference devices that not only show Android stock skills, but also to show hardware manufacturers ways to best take advantage of the platform. Up to that point, Google seems to want Android manufacturers to build cheaper tablets, but there is also a new goal for this Nexus device: consumer activity. Google obviously wants the Nexus 7 to get in as many hands as possible, and it's immediately clear that the tablet focus is the Play Store. It even says right on the box that this tablet was designed for the Play Store, and those who buy a Nexus 7 receive a \$25 credit for the Play Store to push people even more. Advertising revenue is one thing, but having a viable content store that users frequently buy from is a proven way to bring in not only revenue, but also to push the hardware. Both Apple and Amazon have proven this, and Google wants to push forward the entire Android tablet ecosystem, not just its own ad revenue. Content and relationshipsAmbetLe Apple and Amazon put in a lot of work building their content stores before putting a tablet. iTunes and Amazon each had huge amounts of music, video, and books before their tablet release. Apple had a ton of apps available for the iPad launch, and although Amazon didn't have so many apps, its Appstore was carefully curated to make it easier for users to find what they wanted. More importantly, each company had a history built with users, so each company already had payment information for users. Even Barnes & Noble already had payment information, so users had no buying barriers. Google still doesn't really have this relationship with a lot of users. The hope is obviously that the Nexus 7 will sell well because of its price point (and we've already seen that the plan seems to be working), then people will put their information in Google Wallet for use in the Play Store. The first thing you'll notice when you start the new Nexus 7 are the big new widgets used to showcase the Play Store and its content. But at the end of the day, this is a proper Google Android tablet, and not an experience which is actually a problem for Google. Because this is a suitable Android tablet with the entire Play Store available, which means that users can simply install services they already use and pay for Amazon for books, Netflix and/ or Hulu for video, Spotify, Pandora or MOG for music. So even though these same apps were available to iPad or Kindle Fire users, Apple and Amazon Amazon had user payment information. This has made it just as easy for users to get content directly from Apple or Amazon, while third-party services have a bit of an advantage on Google. Catch-22If you spoil us a minute of conspiracy theory, you might make a case that Google owns multiple Nexus 7 stock itself, or is at least giving priority to The Nexus 7 stock, even though there might be more demand through Staples or Walmart. This would cause users to buy the tablet from the Google Play Store, which would force a new user to add payment information. Of course, we have no real reason to believe that this is true other than the fact that the Play Store is the only one around that has not sold out of the tablet. And that could just as easily be explained by the fact that there are likely to be fewer people buying through the Play Store simply because they don't have their payment information set up with the service, which is exactly the problem Google wants to solve. All this to finally bring us to catch-22 of all. Google cannot obtain data about users' payment information in the Play Store if the tablet is purchased anywhere other than the Play Store itself, but users will be less likely to buy from the Play Store because they have not set up payment options and even after purchase, third-party options eliminate the need for payment in the Play Store. Google Play Store has a lot of good content, maybe not as much as competition in many areas, but there is a lot of good content, especially in the app market, and if you want to discover music produced more independently. Those of us already invested in the Play Store are most likely to buy a Nexus 7 from the Play Store itself, so google doesn't give Google any new information you haven't had before. The real challenge is to get those who buy the tablet from Walmart and Sam's Club to set up a Play Store account. New widgets will most likely do a pretty good job of doing just that. Even if people have their information with Amazon it doesn't mean that they are invested in amazon Kindle store, and can't bother to really download many apps. These types of people are the main candidates for media consumption through the Play Store. So if our silly conspiracy theory is correct, it can work against Google by not getting the Nexus 7 into the hands of those who don't have Play Store accounts. You kind of conclusion, the tablet seems to have enough buzz that if Google can keep up with demand, the whole equation can't matter because Google's plan will only succeed through pure numbers. If successful, it could represent a big change for the Android ecosystem. More people will have viable payment options in Play means that more people are purchasing apps; and, more people who buy apps will mean that developers will make more effort to build the selection of tablets for Android, which still needs more attention from the devs. It's a move that Google had to make, even if only to start the entire android tablet ecosystem. Android. The plan is stopped at a good start, and pushing the application is always useful for a new release. But Google needs to make sure that there are enough tablets that come out fast enough that the demand doesn't turn into exasperation, because then people leave. Away.
